15-213: Introduction to Computer Systems

Written Assignment 9

This written homework covers exceptional control flow, processes, error-handling, and signals.

Directions

Complete the question(s) on the following pages with single paragraph answers. These questions are not meant to be particularly long! Once you are done, submit this assignment on Canvas.

Below is an example question and answer.

Q: Please describe the benefit of 2s-complement signed integers versus other approaches (such as 1s-complement or signed-magnitude).

A: For both 1s-complement and signed-magnitude representations of signed integers, we end up representing both -0 and +0, which gets inconvenient when the computer wants to test for a zero result. Additionally, in both of these representations, implementing addition/subtraction is complicated. With 2s-complement, the hardware for addition / subtraction is the same for both signed and unsigned inputs.

Grading

Each assignment will be graded in two parts:

1. Does this work indicate any effort? (e.g. it's not copied from a homework for another class or from the book)
2. Three peers will provide short, constructive feedback.

Due Date

This assignment is due on November 11, 11:59 PM EST. Remember to convert this time to the timezone you currently reside in.

Question 1

Explain in detail what happens if a SIGSEGV is encountered and the process does not have a signal handler defined for it. Is this behavior true for all signals without handlers installed? If so, give brief support. If not, provide a counterexample.

Question 2

What is a system call, or syscall? What is the main difference between a normal function call and a syscall? How is a syscall executed?
